

Antimo Moretti

Nuove acquisizioni nella terapia farmacologica dell'osteoartrosi

Centro Congressi Unione Industriali TORINO 11-13 MAGGIO 2023

Osteoarthritis: progress and pitfalls

- Complex multifactorial and heterogeneous disease
- Joint impairment as a result of articular cartilage degeneration, subchondral bone sclerosis, joint deformation and synovial inflammation
- Continuing to be prevalent in adults and older people

N Schäfer et al. Nat Med 2022 Martel-Pelletier, J et al. Nat Rev Dis Primers 2016 Cui A et al. EClinicalMedicine. 2020

Osteoarthritis therapy: progress and pitfalls

- No therapy succeeded in modifying disease progression— unmet need for novel DMOADs or regenerative therapies
- Consider
 - Pathophysiology and treatment goals
 - Current and emerging treatments

G.U.I.D.A

van den Bosch, M. H. J. Et al. Osteoarthritis Cartilage 2021 Deveza, L. A et al. Clin. Exp. Rheumatol. 2019

Disease-modifying OA drugs (DMOADs)

- To delay or reverse the progression of joint structural damage, leading to clinical translation of improvement in symptoms (pain/function)
- Both structural and symptomatic benefits needed
- New IMP and drug repurposing (cost savings for preclinical and phase I/II for about US\$300 million)

Osteoarthritis therapy: progress and pitfalls

 OA is not a single disease many pathways and risk factors lead to mechanical failure identifying and targeting pathways in early-stage OA would be advantageous.

Grässel, S et al. F1000Res 2020

G.U.I.D.A

Osteoarthritis therapy: progress and pitfalls

- Defining patient subgroups according to pathobiology is challenging – but will enable trials to identify who may benefits from a drug
- Phenotypes can possess several molecular endotypes
 - > Cartilage-driven
 - Bone-driven (e.g., BMLs in MRI)
 - Inflammation (synovitis)-driven

N Schäfer et al. Nat Med 2022

Osteoarthritis therapy: cartilage-driven

Most DMOADs

- Chondrogenesis and ECM production
 > ADAMTS-5 inhibitors, rFGF18 , LNA043
- Cartilage catabolism:
 - Lorecivivint (small-molecule DMOAD, phase 2/3), inhibits WNT–β-catenin signaling decreasing MMPs expression
- Senolytic therapies:
 - Hydrogel miR-29b-5p (aging-related miRNA) promotes recruitment of synovial stem cells and their differentiation into chondrocytes (animal model)

Structure-based therapies (DMOADs)

N Schäfer et al. Nat Med 2022 Oo, W. M Ther. Adv. Musculoskelet. Dis. 2022

Osteoarthritis therapy: cartilage-driven

- Sprifermin (rFGF) increased synthesis of ECM (animal studies)
- 5-y FORWARD study (n=494): maintenance of structure-protective effects of 2-y administration (100 µg every 6 months) despite a treatment-free period of 3 y, good safety profile
 - Symptomatic improvement (WOMAC) in subgroup at risk (SAR) of progression: baseline minimum radiographic JSW 1.5–3.5mm and WOMAC pain 40–90
- Meta-analysis confirmed disease-modifying properties (cartilage thickness, volume and morphology)
 - Structure-protective effects may prevent or delay KOA patients from reaching levels of debilitating pain in the long term

Osteoarthritis therapy: cartilage-driven

- LNA043 derivative of angiopoietin-like 3 (ANGPTL3), potent inducer of chondrogenesis and hyaline cartilage regeneration through binding to the fibronectin receptor (integrin a5β1) on MSC and chondrocytes.
 - Chondroprotective effects during inflammation in candidates for TKR (currently phase 2b)
 - Reversed OA transcriptome vs placebo: induced expression of cartilage ECM components involved in anabolic signaling (lubricin, DKK1, collagen II), suppressed OA mediators (ALP, LEP)

Osteoarthritis therapy: (subchondral)bone-driven

Several phase 2/3 trials

- Cathepsin K inhibitor: reduce cartilage loss but no pain
- Anti-resorptives: reduce bone remodeling and chondroprotective
- Vitamin D
- Anabolic peptide fragments (PTH and ECM phosphoglycoprotein (MEPE)): symptomatic improvement, in a few knees changes in cartilage and SB
 - ➢ Both cartilage and SB (PTH)
 - > SB (MEPE)

N Schäfer et al. Nat Med 2022 Burr DB et al. Nat Rev Rheumatol. 2012

Osteoarthritis therapy: (subchondral)bone-driven

- Non-overweight female patients (BMI<25) with early radiographic KOA (baseline KL<2) revealed a 51% reduction of 2-year radiographic progression after BPs (90% ALN or RSN) (propensitymatched retrospective cohort analysis of the OA Initiative - OAI; n=346)
- No significant effects in patients with advanced OA

Osteoarthritis therapy: synovitis-driven

- Critical for perpetuating OA progression.
- Anti-inflammatory drugs for rheumatic diseases repurposed to OA
- However, most trials targeting cytokines failed
- One promising DMOAD (an IL-10 variant, phase 2) suppresses pro-inflammatory cytokines, chondroprotective and pain relief

Pain-based therapies (NSAIDs and opioids)

N Schäfer et al. Nat Med 2022 Schäfer N et al. Peptides. 2022

Osteoarthritis therapy: pain-based

- Dominant and most debilitating OA hallmark (primary reason for visit)
- Pain sensation in OA progression
 not uniform

N Schäfer et al. Nat Med 2022 Fu, K., et al. Rheumatology 2018 Schmelz, M. et al. Pain 2019 Krupka, E. et al. Osteoarthritis Cartilage 2019

Pain-based therapies (NSAIDs and opioids)

GUIDA

Osteoarthritis: chronic secondary MSK pain – ICD11

 Pain characterized by significant emotional distress and/or functional disability, attributable directly to a known damage process in joint tissues

Perrot S et al. Pain 2019 Nicholas M et al. Pain. 2019

G.U.I.D.A

Osteoarthritis pain: Biopsychosocial and mechanistic approach

- Available pharmacological and nonpharmacological approaches should be individualized to meet the patient's needs.
- Concurrent use medications that work by different MoA and at different sites might be associated with better analgesia/fewer AE

- Pain difficult to explain solely by radiological structural changes
- One reason for this discrepancy is pain sensitization
- Cytokines, NGF, and serotonin targets for OA pain with peripheral/central sensitization

Ohashi Y et al. Cureus 2023

GUIDA

Osteoarthritis: pain sensitization and aging

- Joint nociceptors active during cartilage damage or synovitis (hyperexcitability - innocuous or mild irritations)
- Afferent nerve firing rate increased with aging in guinea pig model

McDougall JJ et al. Pain. 2009

Osteoarthritis: pain sensitization and cytokines

- Inflammation-associated molecules (PG, BK, TNFa, IL-1β, IL-6, DAMPs) ligate to sensory nerve fibers via TRP and sodium channels → lower excitation threshold on highthreshold neurons (joint nociceptors)
- Primarily expressed by synovial macrophages in OA

G.U.I.D.A

Osteoarthritis: pain sensitization and clinical outcomes

 Present in OA, associated with symptom severity, and may affect postoperative pain persistence in TJR

Fingleton C et al. Osteoarthritis Cartilage. 2015 Ohashi Y et al. J Pain Res. 2021

G.U.I.D.A

Osteoarthritis therapy: duloxetine

- Adding to usual care for end-stage KOA/HOA with pain sensitization
- Pre-operative seems to improve residual pain in the early post-operative period

Koh IJ et al. J Bone Joint Surg Am. 2019 Blikman T et al. BMC Musculoskelet Disord. 2022

GUIDA

Osteoarthritis therapy: anti-NGF

 Failed due to ADR (fast OA progression), new strategies to inhibit NGF-induced pain concentrate on antagonism of its receptors TrkA and p75NTR, but do not provide prolonged pain reduction

16 September 2021 EMA/CHMP/556162/2021 Committee for Medicinal Products for Human Use (CHMP)

In conclusion, the benefit-risk balance of tanezumab in the treatment of "moderate to severe chronic pain associated with osteoarthritis (OA) of the hip or knee in adult patients for whom treatment with non-steroidal anti-inflammatory drugs (NSAIDs) and/or any opioid is ineffective, not tolerated or inappropriate" is considered to be negative.

Anti-NGF treatments for pain — two steps forward, one step back?

Nancy E. Lane and Maripat Corr

Inhibitors of β -nerve growth factor (NGF) have impressive effects in reducing musculoskeletal pain, but have also been associated with adverse events of unclear aetiology. Several studies in the past year have sought to clarify the relative benefits and risks of anti-NGF treatment.

Osteoarthritis therapy: TRPV1-agonists

- TRPV1: nonspecific cation channel that opens with exposure to heat, acid; within peripheral nervous system selectively expressed on nociceptors
- After a brief period of activation, capsaicin induces a long-term desensitization (reversible) of nociceptors related to calcium influx into Aδ and C fibers
- Capsaicin injection: tolerated and dose-dependent improvement in KOA pain

- RTX-GRT7039 (Stable formulation of resiniferatoxin), high-potency ligand at the TRPV1
 - Thousand times "hotter" than capsaicin (16 billion Scoville units vs 16 million), selectively ablates the nerve endings responsible for pain, transient nerve ending ablation can have profound clinical benefits lasting for months
- Phase II trials with RTX-GRT7039 (ex name MTX-071): potential as an effective and well-tolerated treatment option.
- No safety concern at any dose level (up to 1600 ng) after single IA administration of RTX-GRT7039

Iadarola MJ et al. Pain. 2018

Osteoarthritis therapy: clodronate

• Seems to be effective for pain relief and functional improvement in KOA

Osteoarthritis therapy: progress and pitfalls

- Few DMOADs made it to clinic
- Pay attention to placebo effects due to injections and US-guided procedures (MCID reached) – lack of efficacy on symptoms in trials
- OA definition: ACR/KL 2-3 (missing early responsive period?)
- Time lag of symptomatic improvement translated from structural improvement >2 y (failure of trials with shorter duration)

Adv Ther (2021) 38:4995–5001 https://doi.org/10.1007/s12325-021-01894-5

COMMENTARY

Myths and Truths about Placebo Effect in Rehabilitation for Musculoskeletal Pain

	Wrong structural endpoint	Ę	No effect, magnitude of placebo effect
671	No progressors		Side effects
	Animal to human translation	Ţ	Structure symptom discordance, unilateral vs bilateral disease

Osteoarthritis therapy: injections and placebo

Overarching principles

I. IAT are recommended and widely used in the management of joint diseases.

II. The aim of IAT is to improve patient-centred outcomes.

III.Contextual factors are important and contribute to the effect of IAT.

IV.IAT should be offered in the frame of full individualised information and a shared decision-making process.

V. A variety of health professionals perform these procedures routinely.

EULAR 2021 McMahon et al. Curr Med Res Opin 2021 J Yang et al. J Pain Res 2020

G.U.I.D.A

Take home messages

- OA is highly heterogeneous
- Effective therapies will need to target clearly defined molecular endotypes, restore mechanical joint function and reduce pain
- A 'one-size-fits-all' approach is unlikely to succeed.
- Identification of reliable biomarkers and advanced imaging, as well as stronger interdisciplinary treatment regimens, will be indispensable
- Immense unmet need for effective and safe targeted interventions to inhibit both pain and disease progression.
